

1. Write a PHP script that displays a form which has two textboxes to accept inputs from the user. Upon hitting the **“Submit”** button, it should display a message stating whether or not the second string is a substring of the first string.
2. Your PHP script should display a form with a textbox to accept text inputs. Once you hit the submit button, it should replace all the special characters from the input. For instance, if you type in the text **“P@ss#56word”**, it should show the output similar to the following:

Old string : P@ss#56word

New string : Pss56word
