

Assignment – 6: Cascading Style sheet

1. Create a web page **cssTest.html** with the following content:

The above should be the appearance of your web page without having a style sheet included.

2. Now, create a stylesheet (external) **style.css** that styles the content of your web page as follows:

3. Modify the stylesheet **style.css** (or create a new one), that would make your web page look like the following:

You should use a **class** to style the Heading - 1(yellow background) and an **id** to style the Heading – 2 (green background).

4. Now create another stylesheet **style2.css** that would style your web page as follows (use the **position** attribute. You can read about it [here](#).):

Note: You should not touch any part of your original html code, other than inclusion of the stylesheet. Your web pages **need not** look exactly the same as the above screenshots (we all code differently and that is perfectly fine). The purpose of this exercise is to learn how only with a stylesheet, you can make your web page look very different, keeping the content and other parts of your html file intact.
